1. General Description

The TxP16E™ is a high performance 16-bit MCU, running up to 32MHz and provided with 64K FLASH and total 4K SRAM for high performance process of audio algorithm, power control and motor control. It is the new generation computational kernel for TRITAN Flash DSP series. It has initially aimed at the areas of controller and multimedia digital signal processing (DSP) application to demonstrate its profession. TxP16E furnish with fast **MAC** architecture, which allows multiplication+accumulation instructions to be issued with access memory simultaneously during one cycles. The TR16F064 is equipped with TxP16E and integrating input/output ports, Audio PWM, Timer and Low Voltage Reset...etc on a chip. Built-in high-speed 10-bit ADC can apply to AC power and motor control application easily.

Furthermore, TR16F064 extend its external device connection capability such as Serial ROM/Flash. The internal memory capacity includes 64Kx16 program/data FLASH plus 4Kx16 working SRAM.

2. Features

- ◆ High-performance RISC TxP16E CPU
 - wide working frequency and voltage 1Mhz ~32Mhz@1.8Volt ~ 5.5Volt
 - Operation frequency is programmable by Software
 - Built-in 4096x16 SRAM
 - Hybrid Instruction and data memory share with 64Kx16 Flash ROM
 - Embedded PC Stack Level 24
- ◆ Rich DSP function
 - Hardware Circular Buffer support
 - MAC Computation power : 32MIPS (max.)
 - Multi-Function Support: In MAC calculation, simultaneously access two operands from memory in one cycle
 - Extend Dynamic Range: A 40-bit accumulator to ensure in 512 successive multiple+additions no overflows
- ◆ Embedded Flash 64Kx16
 - Typical 100,000(TR16F064A) / 20,000(TR16F064B) erase/program cycles
 - Greater than 10 years Data Retention
- ◆ Software-based audio processing technical
 - Subband, ADPCM , CELP , Melody systhesis up to 20 channels (Max)
- ◆ Support 20+2(ICE PAD can be as I/O) general purpose I/O port, can be configured to open-drain output
- ◆ Stereo 8~ 16-bit PWM can be adjustable
- ◆ 15 IRQ & 1 NMI
 - NMI is non-mask interrupt, can interrupt IRQ immediately
 - 2 external interrupt
- ◆ 4 bit SPI Master Hardware support DMA transfer
- ◆ SPI Slaver
- ◆ Green Mode
- ◆ Timer1 , Timer2 with Pre-scale
- ◆ Low power instruction
- ◆ 24-Hours / One day Real-Time Clock
- ◆ ICE support Data RAM monitor for motor control debug
- ◆ Support Spread Spectrum clocking to reduce EMI.
- ◆ CPU Array
- ◆ Watch dog timer (WDT)
- ◆ Low voltage reset (LVR)
- ◆ Low dropout regulator(LDO) supply 3.3V/1.8V@20mA (voltage drop 0.1v)
- ◆ PB0, PB1, PB2, PB3 support two edge modes for wake-up function are rising and falling edge trigger.
- ◆ Comparators
- ◆ ADC 10bit / 285 kbps(@ACQT = 4*TAD) / 8 channel

- ◆ Temp. Sensor
- ◆ Microphone
- ◆ 1402 interface
- ◆ **New instruction about ACALL, please refer to “TxP16E Instruction Set Reference”**
- ◆ **New instruction about 3OP, please refer to “TxP16E Instruction Set Reference”**
- ◆ **New instruction about Barrel Shifter, please refer to “TxP16E Instruction Set Reference”**
- ◆ **New instruction about Immediate Value CBL, please refer to “TxP16E Instruction Set Reference”**
- ◆ **Notice item about Flash DSP programming, please refer to “Flash DSP Programming Note(AN0060)”**

4.1 Pin Assignments /Description

Pin Name	I/O	State after RESET	FUNCTIONS
Chip Power			
VCC	I	High	Chip Power Input
VSS	I	Low	Digital Ground
AVSS	I	Low	Analog Ground
VIO	I	High	PortA IO Power input
V33O	O	High	3.3V/1.8V LDO Power Output
VPD	I	High	PWM IO PAD Power Input
VPS	I	Low	PWM IO PAD Ground
Chip Control			
RSTINB	I	High	Low force chip to enter reset mode, internal 30K ohm pull-up
General Purpose I/O Port			
PortA[5:0]	I/O	Low	PortA is programmable Input/Output port
PortB[5:0]	I/O	Low	PortB is programmable Input/Output port
PortC[7:2]	I/O	Low	PortC[7:2] is programmable Input/Output port
PortC[1]/X32KI	I/O	Low	PortC[1] is programmable Input/Output port X32KI: 32K crystal input
PortC[0]/X32KO	I/O	Low	PortC[0] is programmable Input/Output port X32KO: 32K crystal output
PortI[1]/ICE_SCLK	I/O	Low	PortI[1] is programmable Input/Output port ICE_SCLK: embedded ICE clock pin
PortI[0]/ICE_SD	I/O	Low	PortI[0] is programmable Input/Output port ICE_SD: embedded ICE data pin
PWM Audio			
PWMP	O	Low	Digital PWM output(+)
PWMN	O	Low	Digital PWM output(-)

Notice:

- 1. VPD VPS Decoupling Cap 47uF, please close to IC nearly.**
- 2. Power Path of VPD and VPS must pass through Decoupling Cap 47uF into IC.**
- 3. VCC VSS Decoupling Cap 0.1uF, please close to IC nearly.**
- 4. Power Path of VCC and VSS must pass through Decoupling Cap 0.1uF into IC.**
- 5. VSS and AVSS are as close as possible.**
- 6. PCB Layout about power line, Please refer to "Application Note(AN0059)"**
- 7. It should be avoided that INTENA bit0 is turned on/off quickly. If need to turned on/off INTENA bit0 quickly, recommend to use INTMASK bit0. About detail, please refer to "FDSP programming guide".**

5. Function Descriptions

5.1 TxP16E

As shown in the block diagram in Figure 4.1, the TxP16E with MAC module is a 16-bit data width processing capability and all instructions are operated in one cycle except parameter data ROM(PM) access. The TxP16E not only provides general arithmetic such as addition, subtraction, shifter, normalize, and other logical operations, but it also involves MAC and circular buffer operations for complexity digital signal processing.

5.2 TxP16E Registers

The TxP16E contains of register files are illustrated below:

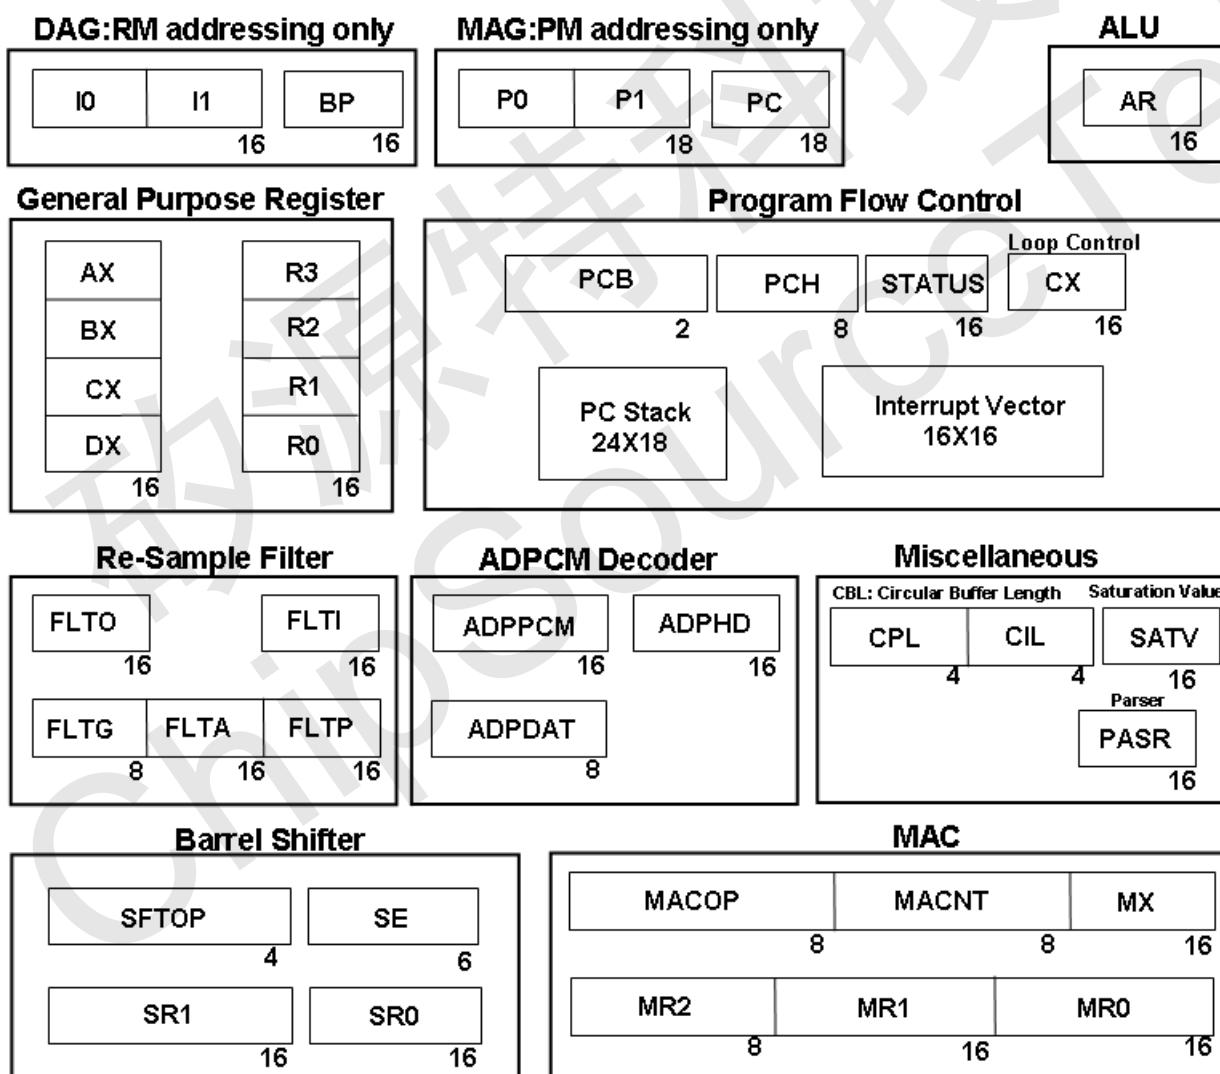

Figure 5.1 TxP16E Processor Core Registers

**■ REGISTER FILES DEFINE:**

AR: Accumulator Register

I0: Index 0 Register

I1: Index 1 Register

BP: Base Pointer Register

P0: Pointer 0 Register

P1: Pointer 1 Register

MACOP: MAC Operation Register

MACNT: MAC Operation Loop Counter

MX: MUL/MAC Input X Register

MR0: MUL/MAC Result Register 0

MR1: MUL/MAC Result Register 1

SFTOP: Shifter Operation Register

SE: Shifter Exponent Register

MR2: MUL/MAC Result Register 2

AX: General AX Register

BX: General BX Register

CX: General CX Register

DX: General DX Register

R0: General R0 Register

R1: General R1 Register

R2: General R2 Register

R3: General R3 Register

CBL: Circular Buffer Length Register

PASR: Parser Register

SR1: Shifter Result Register 1

SR0: Shifter Result Register 0

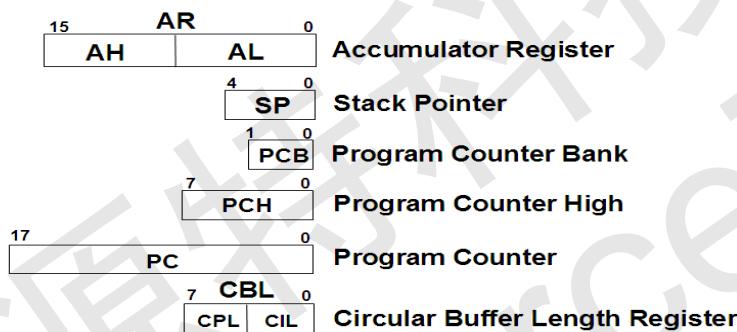

5.2.1 Special Registers

Figure 5.2 TxP16E Special Registers

● Accumulator Register

The AR is a general-purpose 16-bit register that stores the result of last arithmetic or logical operation. In addition, any data write to AR will affect the status flag.

● Stack Pointer

The SP is a 5-bit register that is for addressing Stack position. The SP will automatically increment / decrement cause by instruction "CALL" / "RETS", and more detail revealed as the "PC Stack" section.

● Program Counter Bank

The program memory map is divided into 4 banks by PCB register (Program Counter Bank). Both BANK1 and BANK3 are system reserved. The BANK0 and BANK2 are implemented as Flash memory and static RAM, respectively.

● Program Counter High

The instruction "LJMP" and "LCALL" will refer PCH and PCB registers to compose of 18-bit pointer provides the 4x64K words PM addressing range.

● Program Counter

The 18-bit PC register provides 4x64K-word addressing capability. It is responsible for MCU fetch now executing instruction.

● Circular Buffer Length Register

深圳市矽源特科技有限公司

ShenZhen ChipSourceTek Technology Co. ,Ltd.

TR16F064A(B)

16-bit Multimedia Processor

Many algorithms such as convolution, correlation, and digital filter require the circular data buffers. The TxP16E supports circular buffer operating via the I0 vs. CIL and P0 vs. CPL. The modulus logic implements automatic modulus addressing for accessing RM/PM circular buffer data.

矽源特科技
ChipSourceTek

5.2.2 Common I/O Registers

The TxP16E involves 32 common I/O registers are shown in Table 5.1. There are defined the peripheral IO control and system register.

Symbol	Adr	Reset	RW	B15/b7	b14/b6	b13/b5	b12/b4	B11/b3	B10/b2	b9/b1	b8/b0	Description

Table 5.1 Common I/O registers

5.2.3 Basic System Registers

◆ STATUS register

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description
STATUS.L	00H	20	R/W	INTEN	-	-	AQ	AN	AV	AC	AZ	
STATUS.H	00H	00	R/W	PA	FA	IntVWR	-	IntPrWR	-	SPIS_EN	SPI_M_EN	System Status Flag

The Status register provides two main functions, the first system flag holds the status information generated by the computational blocks of the TxP16E, which used for program sequencer control. The second indicated that special function of hardware module is enable or not.

For program flow control:

System Flag	Definition
AZ	ALU or AR Result Zero
AN	ALU or AR Result Negative
AV	ALU Overflow
AC	ALU Carry
PA	Parser Queue available(Read only)
FA	Filter buffer available(Read only)

System hardware control:

System Flag	Definition
INTEN	System global interrupt control bit
IntVWR	Interrupt Vector Table access window control bit
IntPrWR	Interrupt Priority Table access window control bit
SPIS_EN	SPI slaver interface control bit
SPI_M_EN	SPI master interface control bit

- ◆ Address 01H, 02H and 0AH: Interrupt control registers, the detail are illustrated in Interrupt section.
- ◆ Address 04H~15H: GPIO registers, the detail are illustrated in GPIO section.
- ◆ Address 16H~17H: Audio-PWM control registers, the detail are illustrated in AUDIO section.
- ◆ System Miscellanea register

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description
MISC.L	1CH	00	W/R	0	0	PWM_MUTE	-	RC_RST	EXRST	LVR	WDT	
MISC.H	1CH	00	R/W	Clr_RealT	-	-	-	-	MODX	LDO33_EN	TCS	System miscellanea register

TCS (RealT Timer):

TCS =1: Enable RealT Timer

If programmer read the “RealT” register, it can get 32-bit timer based on **30.517ns(32.768MHz)**. An example is shown as follows.

```

io[RealT] = ar      ; write to reset the state machine of 32-bit real timer.
ar        = io[RealT] ; read low-word timer[15:0]
ar        = io[RealT] ; read high-word timer[31:16]

```

Clr_RealT: Set high to clear 32-bit RealT timer. (this bit only for TCS=1)

TCS =0: Disable RealT Timer

LDO33: Enable LDO 3.3V/1.8V power output. (*Note: When user enable LDO power on, user must insert the power on delay program in order to wait the stable LDO power output.*)

MODX: modx=0 is chosen narrowband sound-effect filter.

modx=1 is chosen wideband sound-effect filter.

Actual bandwidth is dependent on source signal sample-rate.

PWM_MUTE: Audio PWM mute enable

RC_RST: System Reset from internal RC reset

EXRST: System Reset from external reset pin

LVR: System Reset from low voltage reset

WDT: System Reset from watch dog reset

Note: RC_RST, EXRST, LVR will clear WDT bits, except for WDT is set to 1. All of the reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device reset.

◆ Virtual Programming IO

Reserve	19H											

5.3 PC Stack

The PC STACK is TxP16E special embedded memory used to save (PC+1) value, which is composed with 24-level.

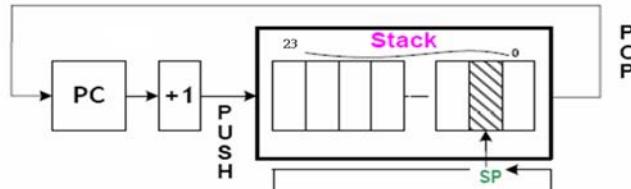

Figure 5.3 PC Stack Structure

Stack's top value is indexed by stack pointer (SP) register. When CALL instruction is executed, then the (PC+1) will PUSH onto stack addressing by SP and it will auto decrement. At the end of subroutine when RETS instruction is executed the SP will auto increment and stack content of pointer by SP will POP into PC.

The contents of STACK and SP are neither readable nor writeable by instruction. The SP is initialized to "0" after RESET.

5.4 Interrupt

5.4.1 Interrupt Vector Table

The Interrupt Vector Table is TxP16E special embedded memory, which is composed with 16-level of FIFO, used to store the index of interrupt service routine (ISR) address. User can access Interrupt Vector Table by read/write IntVect I/O register, which refers PCB register to compose of 18-bit address.

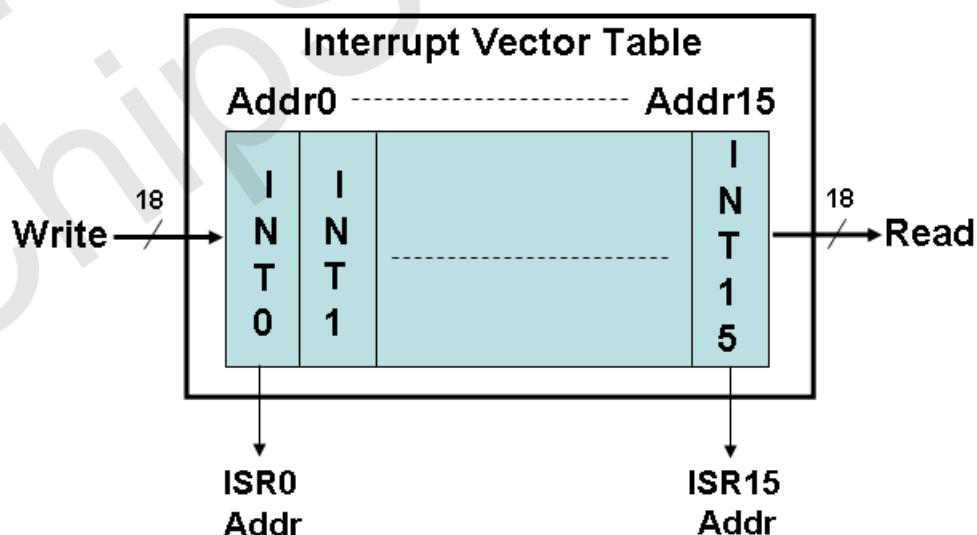

Figure 5.4 Interrupt Vector Structure

5.4.2 Interrupt Controller

Common I/O registers

Symbol	Adr	Reset	RW	B7	B6	B5	B4	B3	B2	B1	B0	Description

This chip provides several interrupt sources, including internal Audio PWM, T1, T2, RTC, SPI master, PC Stack Overflow, SPI slaver, Flash ready, ADC, TRA1402, and 2 external ExtINT0, ExtINT1, interrupts, and NMI interrupt. More details control will describe as follows:

Interrupt Source	Interrupt Vector	Priority(default)
Audio PWM Timer	0H	INT0_IRQ
Timer1	1H	INT1_IRQ
Timer2	2H	INT2_IRQ
RTC Timer	3H	INT3_IRQ
ExtINT0	4H	INT4_IRQ
ExtINT1	5H	INT5_IRQ
SPI Master	6H	INT6_IRQ
PC Stack Overflow	7H	INT7_IRQ
SPI Slaver	8H	INT8_IRQ
Flash Erase/Program Ready	9H	INT9_IRQ
ADC	AH	INT10_IRQ
Reserve	BH	INT11_IRQ
Reserve	CH	INT12_IRQ
TRA1402	DH	INT13_IRQ
Reserve	EH	INT14_IRQ(lowest)
NMI(Non-Mask Interrupt)	FH	INT15_IRQ(highest)

Table 5.3 Interrupt Sources

(a) Global interrupt enable(INTEN)

The global interrupt INTEN controls the enable/disable of all interrupts. When INTEN is cleared to "0", all interrupts are disabled. When INTEN is set to "1", all interrupts are enabled (but still dependent on value of INTENA register). The INTEN is initialized to "0" after power on.

(b) Interrupt enable (INTENA)

The interrupt enable from ENA15 to ENA0 are shown in above. An interrupt is allowed when these control bit are set to "1", and interrupt is inhibit when these control bit are cleared to "0". They are all initialized to "0" after power on.

(c) Interrupt request (INTREQ)

If an interrupt raising edge request is generated, the related interrupt request bit is set to "1" by hardware and waits for interrupt accept. INTREQ can be cleared to "0" by software. Hardware will not clear this bit. INTREQ are all initialized to "0" after power on.

(d) Interrupt mask (INTMASK)

The interrupt can be masked by setting Mask[14:0] interrupt mask register as above. Each interrupt source in the system can be masked individually except NMI.

(e) Programmable Interrupt Priority

INT15_IRQ (highest) > INT0_IRQ > INT1_IRQ > INT2_IRQ > INT3_IRQ > INT4_IRQ > INT5_IRQ > INT6_IRQ > INT7_IRQ > INT8_IRQ > INT9_IRQ > INT10_IRQ > INT11_IRQ > INT12_IRQ > INT13_IRQ > INT14_IRQ(lowest). Interrupt Priority can be programmable, user can re-arrange any interrupt source to wanted interrupt priority except NMI. For Example, user can assign SPI Slaver interrupt source to INT14_IRQ, and then SPI Slaver interrupt priority will be changed to lowest level.

For Example: Exchange ADC priority with Timer1 priority

Assign ADC interrupt source to INT1_IRQ(Interrupt Vector: 1H) and assign Timer1 interrupt source to INT10_IRQ(Interrupt Vector: AH), than ADC priority will be higher than Timer1 priority.

Interrupt Source	Interrupt Vector	Priority(default)
Audio PWM Timer	0H	INT0_IRQ
ADC	1H	INT1_IRQ
Timer2	2H	INT2_IRQ
RTC Timer	3H	INT3_IRQ
ExtINT0	4H	INT4_IRQ
ExtINT1	5H	INT5_IRQ
SPI Master	6H	INT6_IRQ
PC Stack Overflow	7H	INT7_IRQ
SPI Slaver	8H	INT8_IRQ
Flash Erase/Program Ready	9H	INT9_IRQ
Timer1	AH	INT10_IRQ
Reserve	BH	INT11_IRQ
Reserve	CH	INT12_IRQ
TRA1402	DH	INT13_IRQ
Reserve	EH	INT14_IRQ(lowest)
NMI(Non-Mask Interrupt)	FH	INT15_IRQ(highest)

(f) Configurable NMI Interrupt Source

NMI interrupt source can be programmable. User can assign any interrupt source as NMI interrupt source. For Example, user can assign SPI Slaver interrupt source to NMI(INT15_IRQ), and then SPI Slaver interrupt priority will be changed to highest level.

5.4.3 Interrupt Processing

When any interrupt request(INTREQ) is generated, the acceptance of interrupt is decided by the interrupt enable(ENA) and global interrupt enable(INTEN). If the global interrupt enable(INTEN), related interrupt enable bit(ENA) are set to “1” and related mask bit(MASK) are cleared to 0, that interrupt will be accepted on the next clock. These following procedures will automatically be done in one clock cycle by hardware showing below:

- (1) Program Counter(PC), PCB, PCH, AR and FLAG will be stored in special hardware registers.
- (2) PC will be set to the corresponding interrupt entry address by refer to interrupt vector table.
- (3) The global interrupt enable (INTEN) is cleared to “0”, which avoids the nest interrupt happened.

When interrupt service routine was finished, an RETI instruction will perform the procedures by hardware

showing as follows:

- (1) Restore the stored PC, PCB, PCH, AR and FLAG.
- (2) The global interrupt enable (INTEN) is set to “1”, which allows to accept the subsequent interrupt.

Before executing RETI instruction, the corresponding interrupt request (INTREQ) bit must be cleared to “0” by software. If the request bit is not cleared, the same interrupt will be accepted again.

5.5 MAC (16-bit X 16-bit Multiplier and Accumulator)

A 16 bit x 16 bit MAC is provided for digital signal processing. The core of MAC operation is multiply MX&MY with 2'S complement operand and accumulation previous 40-bit MF then rounding store result in the 40-bit MR register. The basic MAC architecture is shown as Figure 5.5.

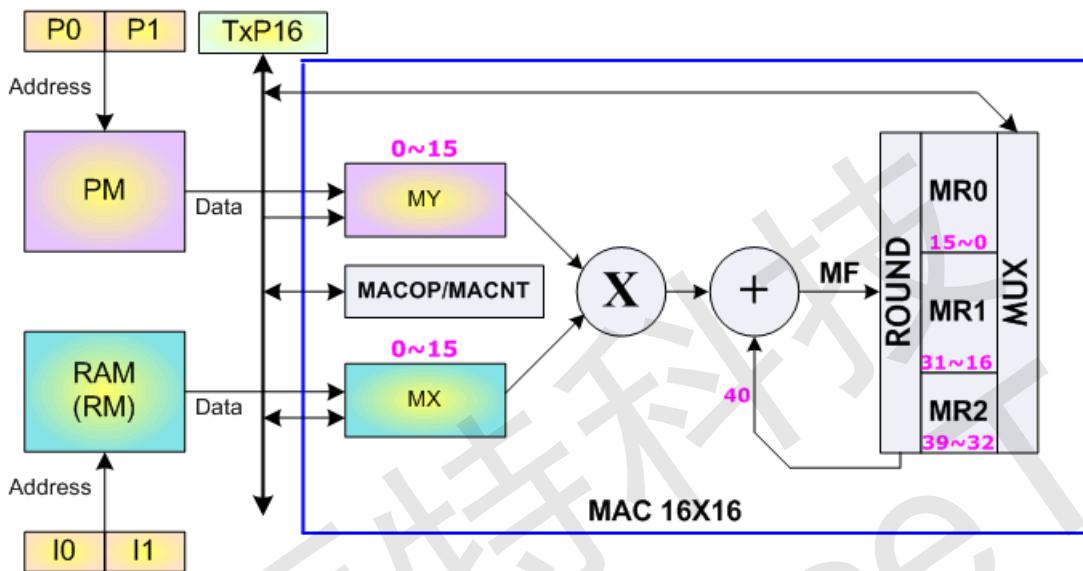

Figure 5.5 MAC Architecture

Define MAC module registers:

MX: MAC input 16-bit X register

MR: Multiplier or MAC result 40-bit register

MACOP: MAC operation define register

Symbol	Reset	RW	B7	B6	B5	B4	B3	B2	B1	B0	Description
MACOP	00	R/W	RND1	RND0	P0/P1	POP:+/-	I0/I1	IOP:+/-	MY:SU(01)	MX:SU(01)	MAC Operation Setup

MACNT: MAC equation loop counter, max to 255

Basically, multiplier operates equation:

$$MR = MX * MY(SU) \rightarrow MX: \text{signed}, MY: \text{unsigned}$$

Permission MY is AR or immediate value (-128~127), MX and MY are signed or unsigned assign by MACOP. So, actual multiplier instruction likes this:

$$MR = MX * AR \quad \text{or} \quad MR = MX * 56$$

The operation of MAC equation is:

$$MR = MR + (MX * MY(SU)) << RND, MX=RM[I0++], MY=PM[P1--]$$

The means of equation is signed MX multiply unsigned MY the result value shift left RND bits and add previous MR then write back to MR.

Simultaneously, load new value to MX fixed from RM[index operation]

MY fixed from PM[pointer operation]

Therefore, MAC array operation like this:

MR = MR + (MX*MY(SS)) << 1, MX=RM[I0++], MY=PM[P1--]

MR = MR + (MX*MY(SS)) << 1, MX=RM[I0++], MY=PM[P1--]

.

.

MR = MR + (MX*MY(SS)) << 1, MX=RM[I0++], MY=PM[P1--]

Successive 64 times

Actual just one line of instruction present in assembly coding like this:

MACNT = 63

This is very benefit for reducing code size. Of course, we need setup MACOP register previous; at this example is like this;

Symbol	Reset	RW	B7	B6	B5	B4	B3	B2	B1	B0	Description
MACOP	00	R/W	RND1	RND0	P0/P1	POP:+/-	I0/I1	IOP:+/-	MY:SU(01)	MX:SU(01)	MAC Operation Setup

Note: Successive MAC operation will cause MCU interrupt disable.

5.6 Barrel Shifter

The shifter accept a 16-bit input and can any place in a 32-bit output. The core of shifter include arithmetic shift, logic shift, exponent detector and normalization. The basic shifter architecture is shown as Figure 5.6.

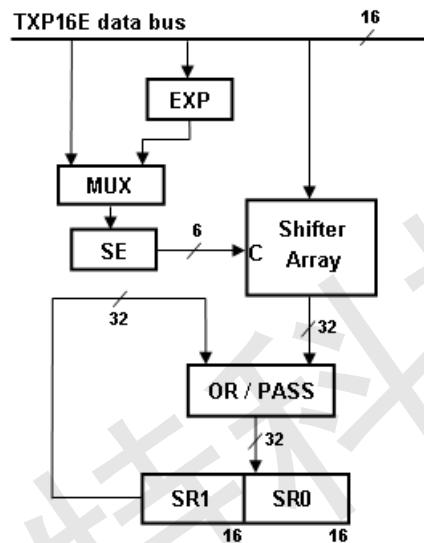

Figure 5.6 Barrel Shifter Architecture

Define Barrel Shifter module registers:

EXP: The EXP (Exponent Detector) register determines the number of leading sign bits and produces output number which indicates to eliminate redundant sign bits during the normalize operation.

SE: The shifting of input is determined by SE register. Positive SE value indicates a left shift and negative SE value indicate a right shift. SE register is set from TxP16E bus or EXP register.

SR1, SR0: barrel shifter result 32-bit register

SFTOP: shifter operation define register

Symbol	Reset	RW	B7	B6	B5	B4	B3	B2	B1	B0	Description
SFTOP	00	W							Arith./Logic	PASS/OR	Shifter Operation Setup

SFTOP[1]: 0(arithmetic shifter, default), 1(logic shifter).

SFTOP[0]: 0(the shifter array output is passed through and load to SR register), 1(shifter array output may be OR logic with SR register, and then OR logic result is loaded into SR register).

6. Memory Configuration

6.1 Internal Program/Parameter Memory

TxP16E consider both instruction and data ROM are the same as program ROM(PM), so it's very flexible and efficient for instruction and data memory allocation in PM. The total of logical PM space is 4 banks. Each bank has 64 K space. The 4 x 64K space is addressed by memory address generator unit (MAG). The BANK0 and BANK2 are implemented as Flash memory and static RAM, respectively. The DFF register starts at the last location of BANK0 (0FFF0h~0FFFFH), and user can dynamically update PM data for MAC operation. More details control will describe as follows:

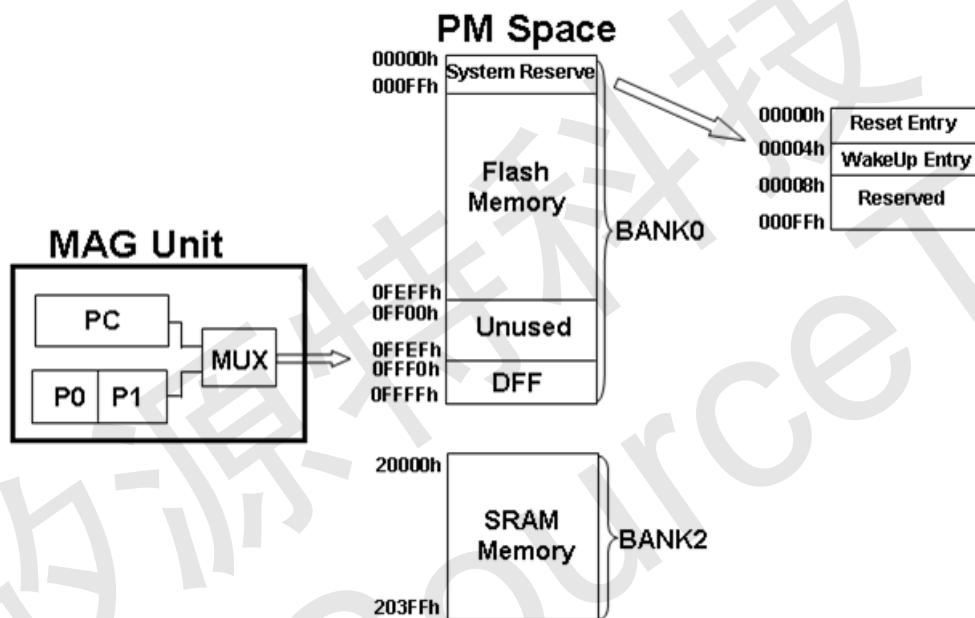

Figure 6.1 PM block diagram

When TxP16E executed an instruction, the PM address is generated from PC register. Similarly, when it access a word data, the PM address is composed with 18-bit from P0 or P1. System will auto adjust execute target space when program context switch between BANK0 and BANK2.

6.2 Internal Data Working SRAM

The internal data working ram space is totally 4Kx16-bit that named as RM. Addressing ranged from 0x0000 through 0x0FFF, which is generated by Data Address Generator Unit (DAG). Note: Index register (I0,I1,BP) are 16-bit width, but RM address line is only 12-bit width(0~4095); therefore, RM address will be warping when index value exceed 4095.

Note: Total SARM size is 4Kx16-bit. If PM(BANK2 / 1Kx16-bit) is used, RM will be 3Kx16-bit. If PM(BANK2) is no used, RM will be 4Kx16-bit. SARM configuration is set by option code.

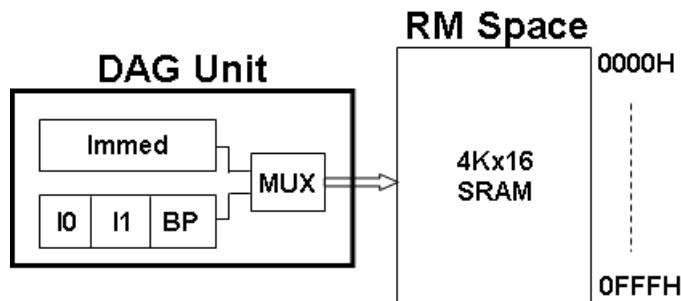

Figure 6.2 RM block diagram

6.3 Data Stack

A Last In First Out (LIFO) STACK is implementation for temporary data storage in RM memory. Generally, Data Stack is start-up at the bottom of RM, so BP is usually set to 0x0FFF.

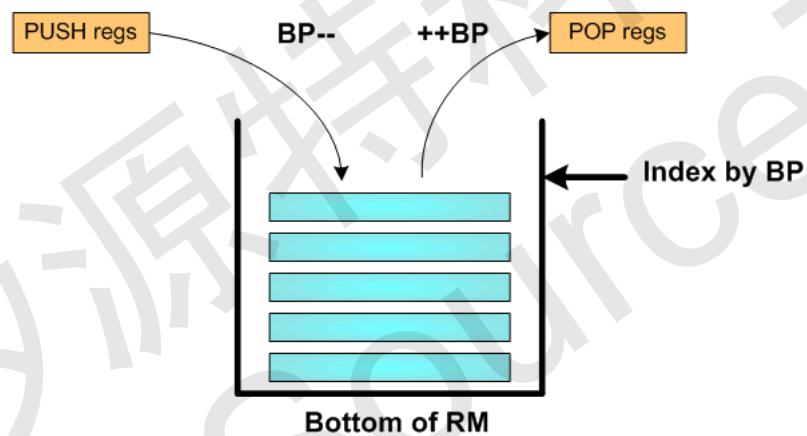

Figure 6.3 Data Stack Structure

Data Stack's top value is indexed by base pointer (BP) register. When PUSH instruction is executed, the "regs" will PUSH onto stack which address by BP and it will auto decrement. If POP instruction is performed, the BP will auto increment and stack content of pointed by BP will POP into "regs".

$$\text{Int1_Req} / \text{Int2_Req} = (\text{External Clock Input} / N) / (\text{TnC} + 1)$$

Timer1_prescale[3:0]	Timer2_prescale[3:0]	N

Timer Pre-scale Table

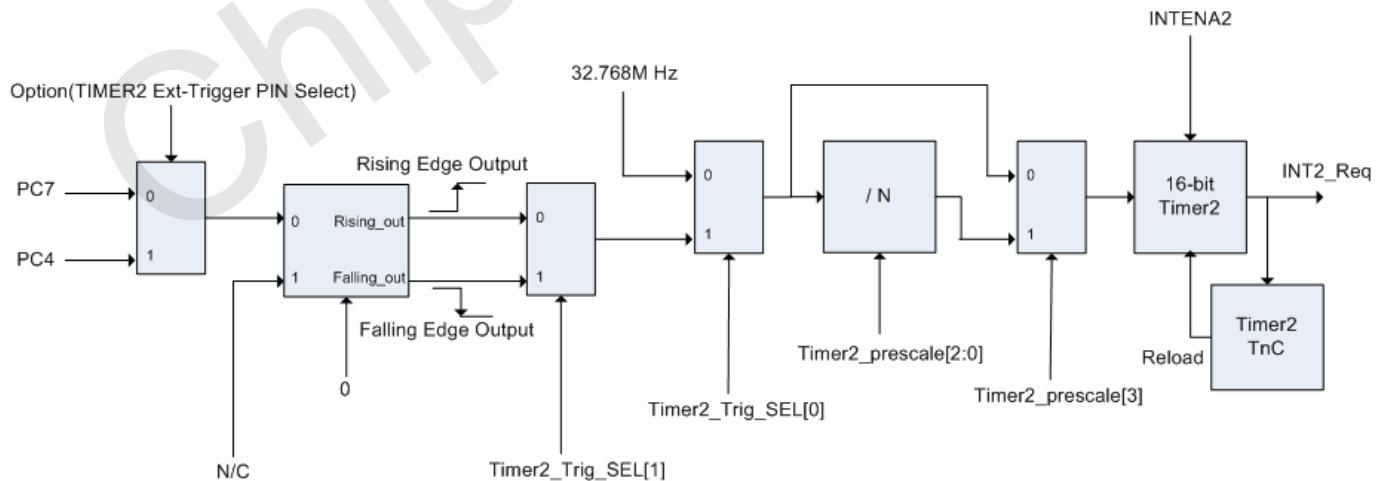

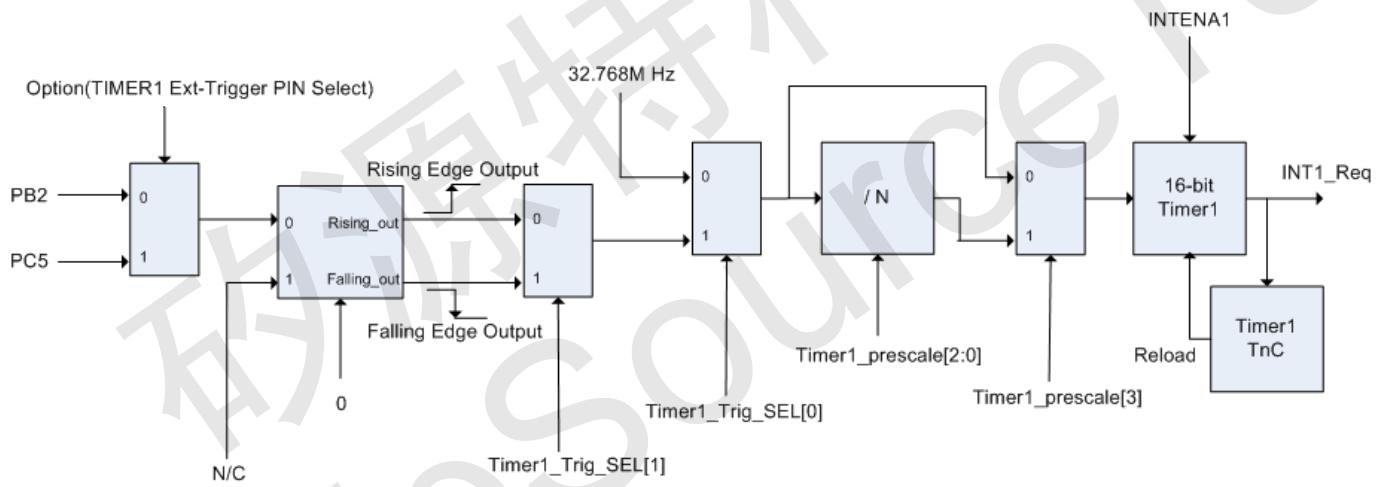

Figure 7.2 Timer1 & Timer2 Structure

7.1.3 RTC(Real Time Clock) Timer

The RTC Timer input frequency can select 32K XTAL(32768Hz) or Low power RC oscillator 32768Hz \pm 2% (LP32K) by option. It contains 16-bit counter register. RTC generates interrupt request or wake-up MCU when in halt mode or interrupt in normal mode. The wake-up function can be disabled by option.

$$\text{The frequency of Int3_Req} = 32768\text{Hz} / (\text{RTC Timer TnC} + 1)$$

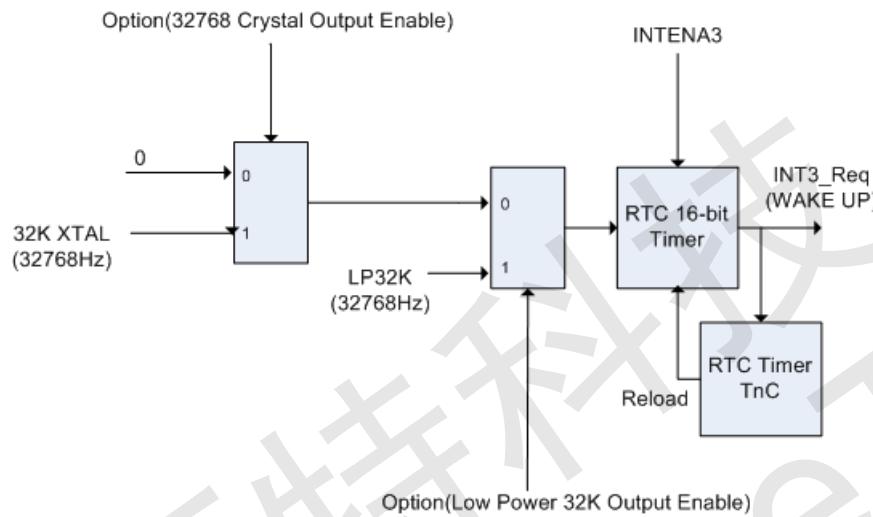

Figure 7.3 RTC Timer Structure

7.1.4 Green Mode Timer (GRTimer)

The Green Mode Timer input frequency can select 32K XTAL(32768Hz) or Low power RC oscillator 32768Hz \pm 2% (LP32K) by option. It contains 13-bit counter register. GRTimer generates wake-up MCU signal when in green mode. GRTimer range is from 0 to 0x1ffe. If GRTimer value is larger, working frequency at green mode is slower.

$$\text{The frequency of green mode} \doteq 32768\text{Hz} / (\text{GR Timer TnC} + 4.06448)$$

Note: If green mode function is executed, RTC wakeup in halt mode/Green mode of IDE option need to be enabled.

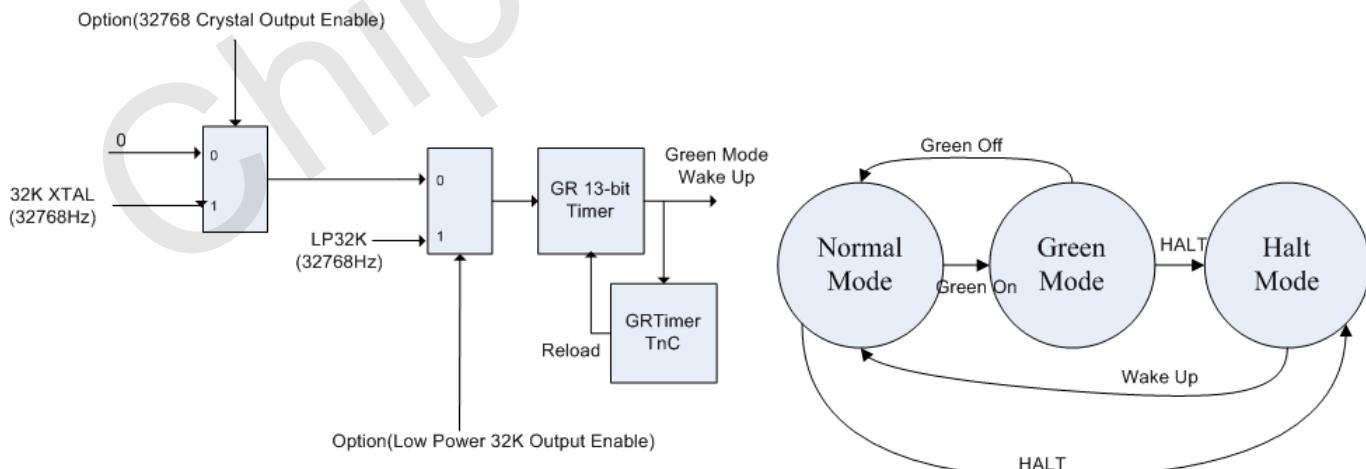

Figure 7.4 Green Mode Timer Structure & state diagram between the different modes

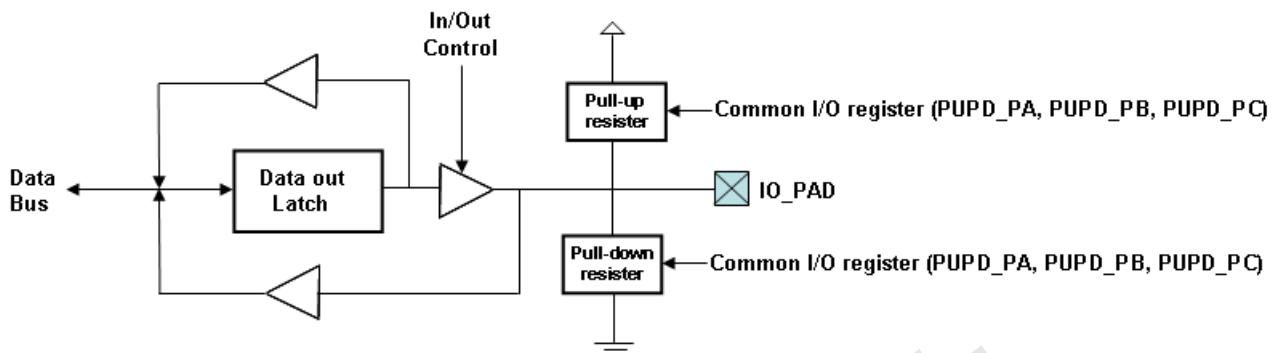

Figure 7.5 Basic I/O Configuration

PB0, PB1, PB2 and PB3 support two edge modes for wake-up function are rising and falling edge trigger. The rising and falling edge trigger is selected by user program.

Virtual Programming IO Port

WAKEDLV_PB	16H	00	W									PortB Double-Edge WAKE UP Enable

The PortB0, PortB1, PortC6, PortC7 also provides 2 comparators configuration for user application that each comparator enable or disable by option.

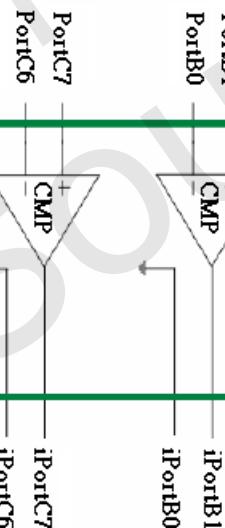

Figure 7.6 Comparator Configuration

7.3.1.3 DMA Control/Data Registers

Symbol	Adr	Reset	RW	b15/b7	B14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description
CTRL_W.L	53H	00	W	-	-	-	SET_CONTROL_MODE	DMA_AUTO_RSET	DMA_DIR	DMA_EN	-	Control Register Low Byte
CTRL_W.H	53H	00	W	-	-	-	-	-	-	-	-	Control Register High Byte
CTRL_R.L	53H	00	R	-	-	-	-	-	DMA_DIR	DMA_EN	DMA_BUSY	Read Status Low Byte
CTRL_R.H	53H	00	R	-	-	-	-	-	-	-	-	Read Status High Byte

DMA_BUSY: Indicate DMA transmitting/receiving data now.

DMA_EN: 1-> DMA Enable, 0->DMA Disable

DMA_DIR: 1-> DMA Direction, From SPI to RM SRAM, 0-> From RM SRAM to SPI

DMA_AUTO_RESET: 1-> the index address of DMA SRAM will be auto reset when DMA transmitting/receiving data completed.

SET_CONTROL_MODE: 1-> Enable setting control mode.

1. If SET_CONTROL_MODE is set to high, user can change another mode by setting bit15 of CTRL_W register. If set bit15 of CTRL_W register to high, improved control mode is choose.
2. If set bit15 of CTRL_W register to low, old control mode is choose.

Improved control mode is that user can access SPI data, don't need to polling DATOK.

Symbol	Adr	Reset	RW	b15/b7	B14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description
SPI_RADR.L	54H	XX	W				SPI_RADR[7:0]					RM SRAM starting address for DMA
SPI_RADR.H	54H	XX	W	-	-		SPI_RADR[13:8]					
SPI_DMANUM.L	55H	00	W/R				SPI_DMANUM[7:0]					Set the length of DMA transfer
SPI_DMANUM.H	55H	00	W/R	-	-	-	-	SPI_DMANUM[11:8]				

After SPI_DMANUM register is written, DMA transfer is issued. The number of SPI_DAMNUM is up to 0x0fff (4K words length).

Example:

PortA[3:0] of CHIP1 is configured to SPI master, and through PortB[3:0] of CHIP2 to PortC[7:4] of CHIP2, and PortC[7:4] of CHIP2 is connected to PortA[3:0] of CHIP3 (SPI slaver) in this example. CHIP1 can communicate with CHIP3 and go through CHIP2. CHIP2 can monitor the communication data of CHIP1 between CHIP2.

Figure 7.7 is the CPU array connecting diagram of this example.

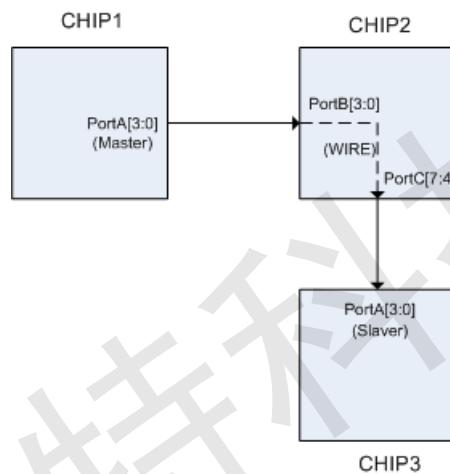

Figure 7.7 The connecting diagram of CPU array

7.3.5 High Speed 8channel / 10 bits signed ADC

7.3.5.1 Features

- 8 external I/O input Channels
- 10-bit Signed ADC
- Up to 200K samples per second (@ACQT = 2*TAD, ADC clock = 4Mhz)
- Programmable acquisition time
- ADC start conversion by S/W, Audio PWM, Timer, RTC or External I/O pin

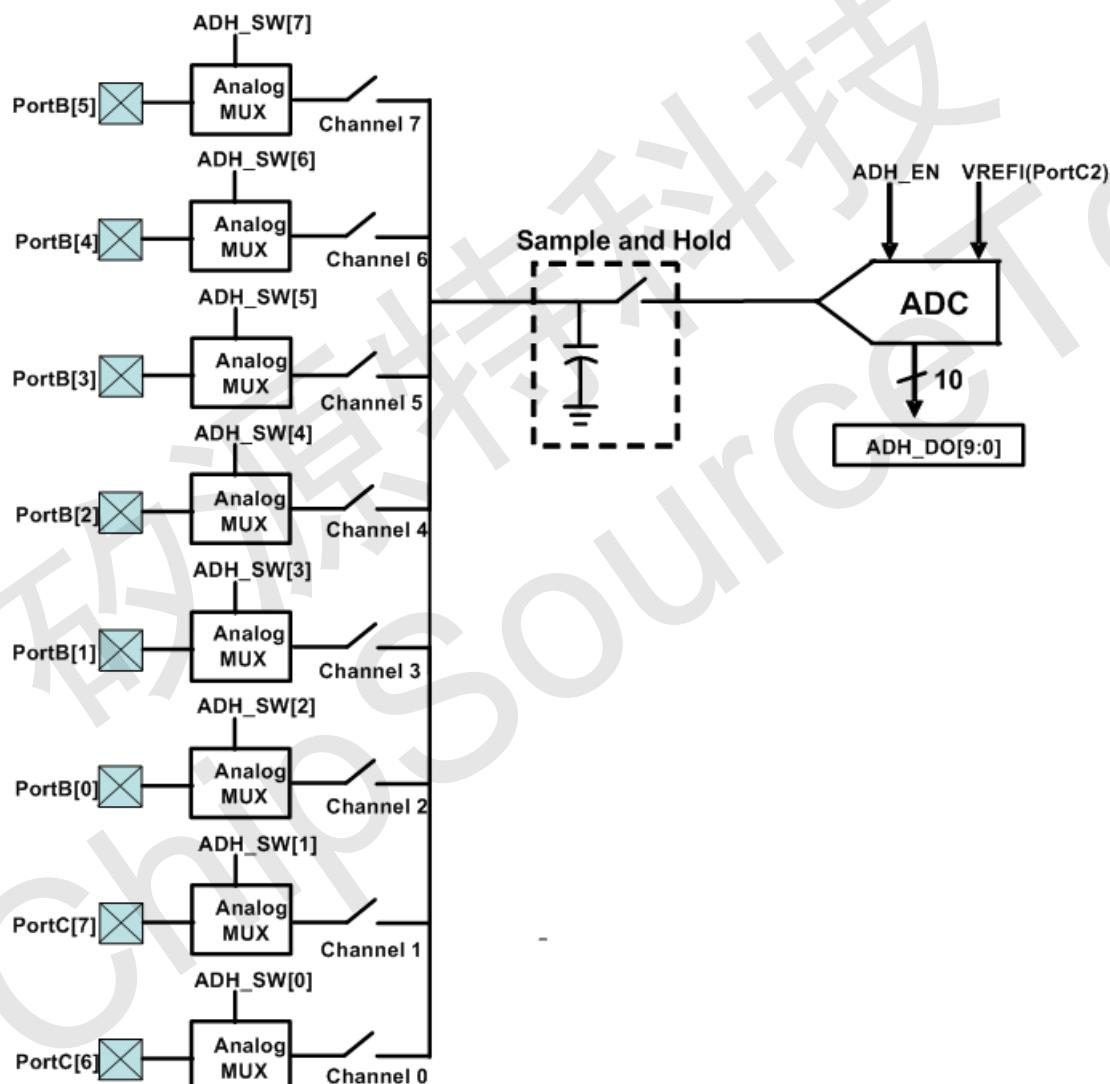

Figure 7.9 High speed 8-Channels / 10-bits ADC Structure Diagram

Note: If user need more precise ADC for application, user can use PortC2 as voltage-reference input(VREFI) of ADC. Independent voltage-reference input pin can improve ADC precision.

Note: Enable ADC verf input at option, PortC2 is as ADC voltage-reference input(VREFI), not as I/O pin.

*** The decouple capacitor (10uF) must be as near as possible to VCC and VSS.*

Note: If user need to enable more A/D channels than one, user should enable ADC interrupt in order to read A/D conversion data of more channels. When some one channel is converted completely, it will generate an interrupt to CPU. Every active channel is converted sequentially.

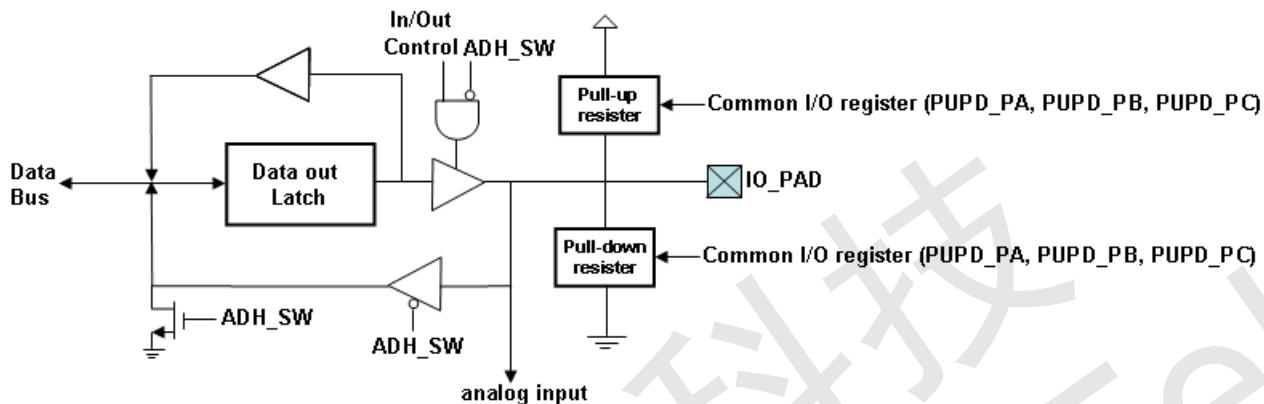

Figure 7.10 ADC External I/O Input PAD Diagram

** The decouple capacitor (10uF) must be as near as possible to VCC and VSS.

Auto_Polling: Enable Auto-Polling mode. (See Figure 7.11)

Continuously polling tra1402 status bit **FEPT/DRDYEN** by hardware and generate interrupt when reading tra1402 status bit **FEPT/DRDYEN** is high.

FIFO_MODE:

1: Auto Polling tra1402 status bit **FEPT** on tra1402 FIFO mode.

0: Auto Polling tra1402 status bit **DRDYEN** on tra1402 Non-FIFO mode.

Auto_Polling	FIFO_MODE	Function Description
0	X	Disable Auto-Polling mode
1	0	Auto Polling tra1402 status bit DRDYEN on tra1402 Non-FIFO mode
1	1	Auto Polling tra1402 status bit FEPT on tra1402 FIFO mode

Note: It not necessary for generating interrupt at Auto-Polling mode that TRA_INT_EN is set to high.

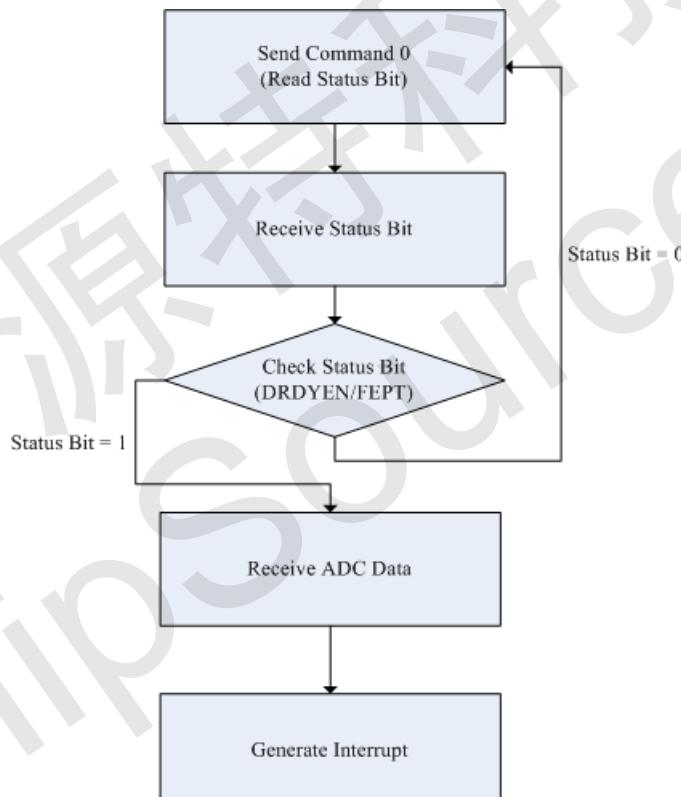

Figure 7.11 Auto-Polling Mode

7.4 Stereo Audio-PWM Output

Two 16-bit of digital-to-analog convert are built-in TR16F064 for stereo audio application. In order to get more output power driving, which require external amplifier for stereo output pin LCh and RCh.

Common I/O registers

Symbol	Adr	Re set	RW	b15/b7	b14/b6	B13/b5	b12/b4	b11/b3	b10/b2	b9/b1	b8/b0	Description	
Audio-PWML	16H	XX	W	Audio-PWML [15:0]									Audio-PWM Audio L Channel
Audio-PWMR	17H	XX	W	Audio-PWMR [15:0]									Audio-PWM Audio R Channel

7.5 Auto-FIFO

The Auto-FIFO allows user transfer base on 4-level of data to Audio-PWM. In some case of frame base applications that data transfer is more efficient than sample base. It is advantageous to decrease number of context switch between main program and interrupt service routine (ISR). The FIFO structure reveal as below:

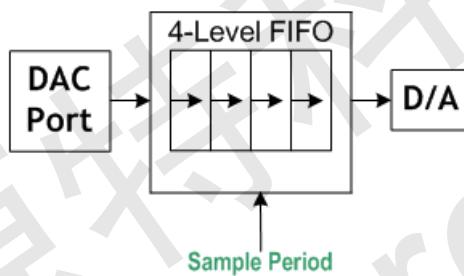

Figure 7.12 Auto FIFO Structure

An interrupt is generated when an entire 4-level FIFO is transfer completed (D/A FIFO buffer is empty), then interrupt service routine should re-load 4-level data to FIFO at ones during 32K or 64K sample period. The FIFO will automatically shift-out data to Audio-PWM at each sample period.

Note: Auto-FIFO is enable/disable by option setup.

8. Flash Control

8.1 Flash Structure

TR16F064 is built in 64Kx16 program/data FLASH memory. This Flash is offered with sector endurance of more than 100,000(TR16F064A) / 20,000(TR16F064B) cycles, Data retention is rated at greater than 10 years. It is suited for convenient and economical updating of program, configuration, or data memory.

The sector architecture is base on sector size of 256 words/512 bytes. The sector erase operation allows the system to erase the device on a sector. The sector architecture is shown as Figure 8.1.

Sector Select(255 sectors)										Word Select(256 words)							
A15	A14	A13	A12	A11	A10	A9	A8		A7	A6	A5	A4	A3	A2	A1	A0	

Figure 8.1 The sector architecture

Note: Last sector(256th sector) is an empty sector, user can't use it. Address range of last sector is from 0xff00 to 0xffff.

8.2 Flash Sector Erase

The Sector Erase instruction needs to assign erasing sector number to AR register. When “PE = AR” instruction is executed, select of sector will be erased.

Example: Erase 16th sector (0x1000 – 0x10FF)

```
AR  = 0x0010 // assign erasing sector number  
PE  = AR      // sector erasing
```

Note: Erasing time of one sector is 4.7ms.

8.3 Flash Programming

8.3.1 Word Programming

TR16F064 provide one word programming instruction. The Word Programming instruction needs to assign programming data to AR register and assign programming address to P0/P1 register. When “PM[P0/P1] = AR” instruction is executed, select of flash address will be programmed.

Example: Program 16th word address (0x0010)

```
P0 = 0x0010      // assign programming address  
AR  = 0x5678    // assign programming data  
PM[P0] = AR     // word programming
```

Note: Programming time of one word is 37us.

8.3.2 Sector Programming by DMA

TR16F064 provide one sector programming by DMA. The Sector Programming by DMA needs to assign programming data to SRAM and assign programming sector number to AR register. When “PP = AR” instruction is executed, select of sector will be programmed

Example: Program 16th sector (0x1000 – 0x10FF)

```
AR = 0x0040 // assign SRAM start address of programming data to AR  
SA = AR      // write in SRAM start address  
AR = 0x0010 // assign programming sector number  
PP = AR      // sector programming
```

Note: Programming time of one sector is 4ms.

8.4 Flash Read

8.4.1 Word Read

TR16F064 provide word read instruction. The Word Read instruction needs to assign reading address to P0/P1 register. When “AR = PM[P0/P1]” instruction is executed, select of word will be read out to AR register.

Example: Read 16th word address (0x0010)

```
P0 = 0x0010 // assign reading address  
AR = PM[P0] // read word data
```

Note: Reading time of one word is two cycle of System Clock.

8.4.2 Sector Read by DMA

TR16F064 provide one sector read by DMA. The Sector Read by DMA needs to assign read sector number to AR register. When “PR = AR” instruction is executed, select of sector will be read to SRAM

Example: Read 16th sector (0x1000 – 0x10FF)

```
AR = 0x0040 // assign SRAM start address of read data to AR  
SA = AR      // write in SRAM start address  
AR = 0x0010 // assign read sector number  
PR = AR      // sector read
```

Note: Read time of one sector is 145us.

9. Others

9.1 Low Power Instruction

Low power instruction is used to reduce power consumption at the short time idle. For example, program is waiting a trigger (external I/O key input) at main loop of polling trigger. User can insert low power instruction into main loop of polling trigger in order to reduce power consumption. Low power instruction can reduce half power consumption of normal running (no insert low power instruction).

Low power instruction can stall CPU the cycle number of user define. During stall CPU, once interrupt or wakeup is happened, CPU will exit stall mode immediately.

Example: CPU will stall 256 cycles.

```
SPEEP EQU 66H
```

```
ar = 0x00ff;  
io[SLEEP] = ar;
```

9.2 Dynamic System Clock

Operation frequency can be adjusted by software dynamically. User can adjust operation frequency in order to reduce power consumption.

Write Data	CPU Operation frequency
0	1 MHz
1	2 MHz
2	4 MHz
3	6 MHz
4	8 MHz
5	16 MHz

Example: Change CPU Operation frequency to 2MHz.

```
SPEEP EQU 67H
```

```
ar = 0x0001;  
io[SPEED] = ar;
```

9.3 Spread Spectrum Clocking (SSC)

TR16F064 provide software algorithm with SSC hardware to reduce CHIP EMI. This function can reduce EMI by dynamically adjusting frequency.

Note: Please see Tritan Macro Liberry for reference.

9.4 ICE Data RAM Monitor

ICE support Data RAM Monitor for motor control debug. SRAM content can be real-time monitoring by Data RAM Monitor. User can use Data RAM Monitor to monitor slowly varying parameter of control algorithm. Address of monitor can be assigned by user.

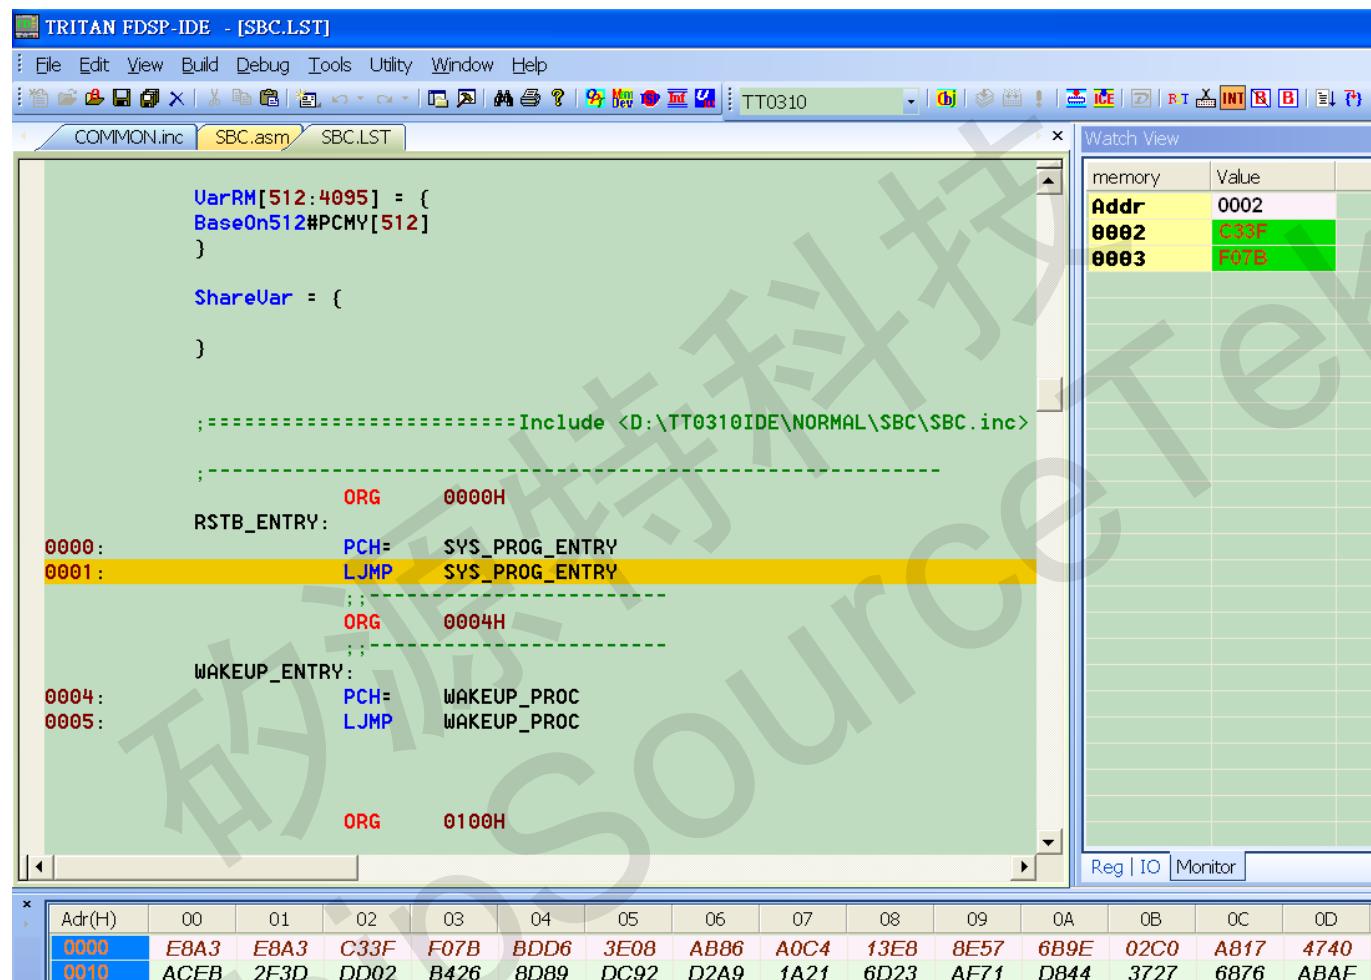

Figure 9.1 IDE operating window of ICE RAM Monitor

9.5 Temperature Sensor

Temperature sensor is providing a voltage that is inverse ratio as temperature. It must set TEMP_EN = 1 (See 9.7 microphone, MIC b12 =1) for enable the sensor reference voltage and set ADH_SW[11] = 1 for ADC input. User can refer to temperature macro.

** (Temp. sensor - 1.7mV = temp + 1°C).

**Temp. ADC data is on flash address 0x10003(Temp._ADC) at VCC=4V and temp. = 35°C

9.6 Low battery detector

Low battery detector is used to detect the “Vlbd” by a 0.8V bandgap reference. It must set ADH_SW[9] = 1 and start the ADC to read the 0.8V bandgap reference. User can refer to LVD macro.

The accuracy of low battery detector about ± 5 0mV in typical

9.7 Microphone

MIC.H	64H	00	R/W	-	-	-	TEMP_EN	-	-	-	MIC_EN	Microphone & Temperature Sensor

*MIC_EN : Microphone Enable

*TEMP_EN : Temperature Sensor Enable

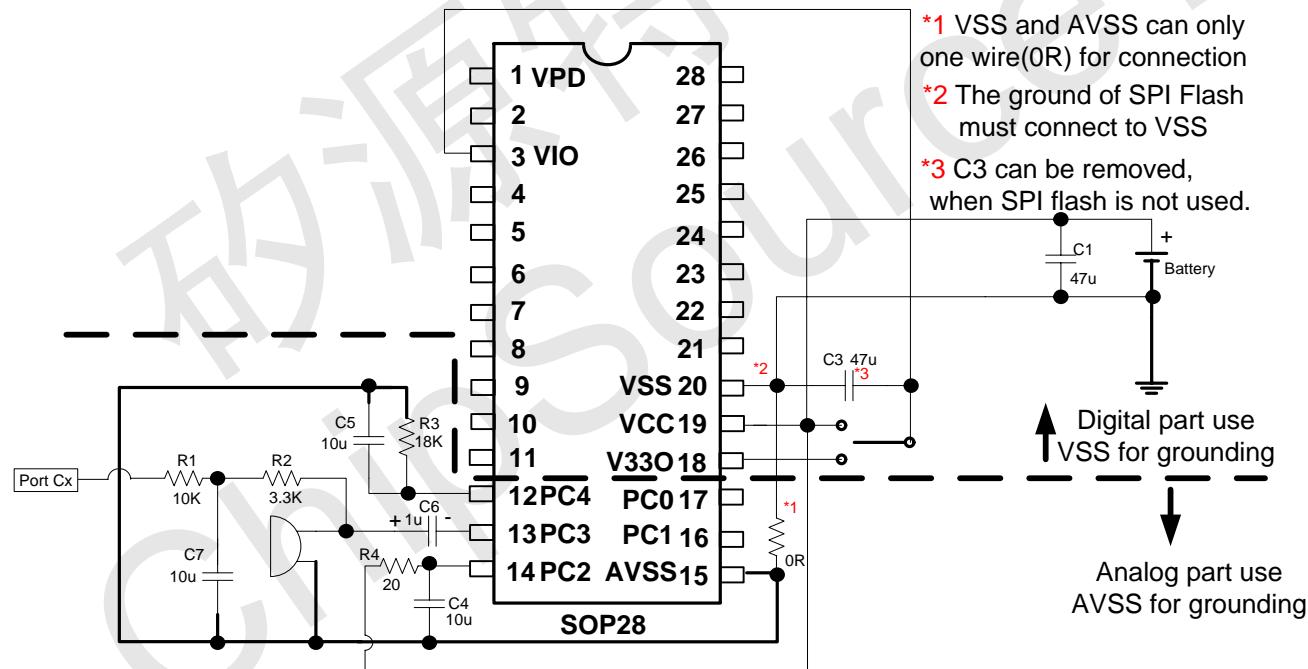

Fig 9.2 Microphone recorder application circuit (Standard version)

Note : User can use PC2(Enable the option of ADC vref input) as voltage-reference input(VREFI) of ADC for microphone application.

Note: PC3 is microphone pre-amplifier input

Note: PC4 is the bias(VMID) for microphone pre-amplifier

Note: The microphone circuit is only for microphone signal (small signal), can't support line in signal (large signal).

Note: Port Cx must be set to low at sleep mode in order to save power.

The optimum version (Fig 9.3) is used in the design. The voltage of PC4 must be checked for different microphone impedance, it must be below (1/2 VCC-0.1V) at highest operating voltage that can adjust by R2 (2.2K ~ 10K).

R-option (parallel with microphone) can help to adjust PC4 voltage below (1/2 VCC-0.1V), when R2 adjustment can't do it.

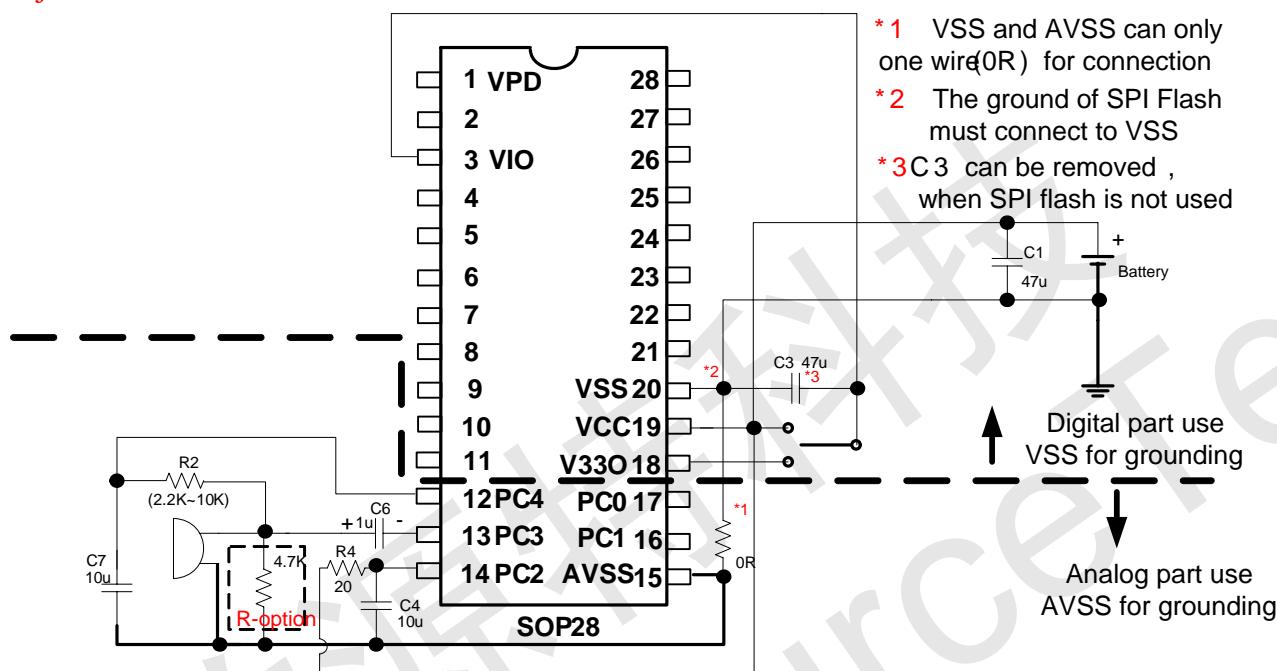

Fig 9.3 Microphone recorder application circuit (Optimum version)

There is a programmable gain amplifier (PGA) in the microphone circuit. Default gain is 37db, (PGA [5:0] = 30h).

Each gain step is 1db. Maximum gain is 52db, minimum gain is -11db. PGA Input resistance is ~ 2Kohm.

PGA output is connected to ADC input (ADH_SW [8]).

User must use PortC2(Enable the option of ADC vref input) as voltage-reference input(VREFI) of ADC for microphone application.

The microphone circuit is only for microphone signal (small signal), can't support line in signal (large signal).

10. System Control

10.1 Halt Mode & Wake up

The TR16F064 is changed into HALT mode (system clock stop, RTC stop by Option setup) when HALT instruction executed. It provides a power saving mode for those applications requiring a very low stand-by current. The RTC timer, PA0~PA5, PB0~PB5 and PC0~PC7 are supporting the wake-up MCU function when related I/O port raising/falling edge which selects by program. The program counter will be 04H when HALT instruction executed immediately; in addition, when wake up condition is occurred, MCU will release HALT state and program counter go-to next address after difference stable clock is delayed by option. During the Halt mode period, the SRAM will keep their previous data without changing.

10.2 Watch Dog Timer Reset (WDT)

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	B11/b3	b10/b2	b9/b1	b8/b0	Description
ClrWDT	1DH	XX	W									Clear WDT
RealT	1DH	0000	R									Watch Dog Real-Time Counter

The watch dog timer (WDT) is used to reset whole chip when detect unexpected execution sequence of instructions caused by accident condition, avoiding dead lock of MCU program. Software shall run an "clear watch dog timer"(CLRWDT) instruction before this timer time out. It will generate a reset signal to reset whole system when WDT overflow.

WDT will be reset when wake-up from halt or after power on or software clear. In test mode, watch dog timer will be disabled no matter watch-dog-timer is time-out or not.

The reset watch dog timer code syntax is strongly recommended as: "**CLRWDT = AR**".

10.3 Low Voltage Reset

When VCC power is applied to the chip, the low voltage reset is initially enabled by default, it will be disabled when in halt mode. The internal system reset will be generated if VCC power below the voltage of LVR(option setup). The normal operation of LVR is always enable expect disable in HALT mode.

10.4 Reset System

The TR16F064 reset is come from four signals which are power on reset, low voltage reset(LVR), external "RSTINB" pin and WDT overflow reset. A dedicated resetb input pin is provided to reset this chip. For normal operation of this chip, a good reset is needed. This pin has 30K ohm pull up resistor. The operation frequency of MCU will go back to BANK0 mode when reset occurred.

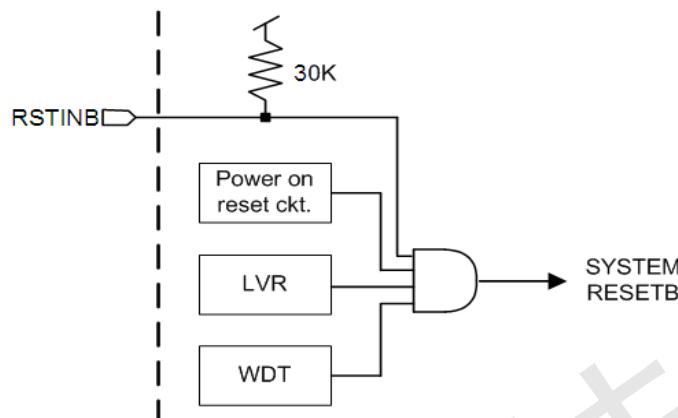

Figure 10.1 Reset system block diagram

10.5 Clock System Architecture

The TR16F064 clock system supports internal ROSC(65.536MHz) for System Clock, and External Crystal 32768Hz or Low power RC oscillator(32768Hz \pm 2%) for RTC function. These crystal pins X32KI and X32KO can be shared with PortC[1], and PortC[0] respectively.

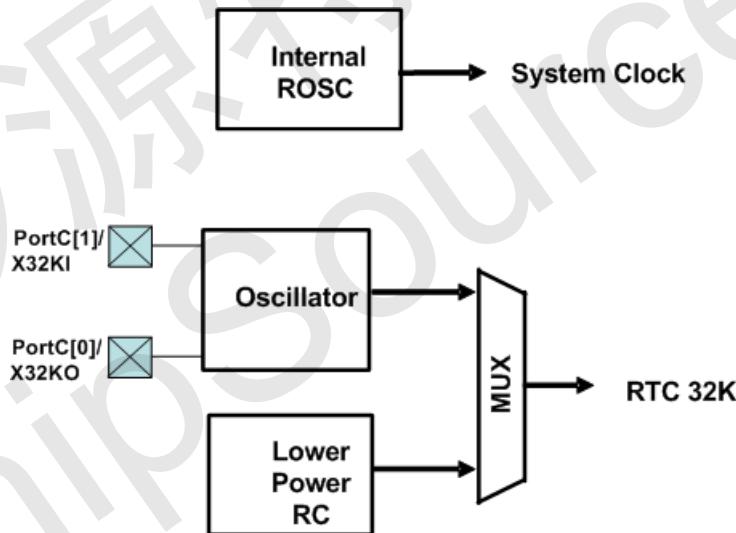

Figure 10.2 Clock System Diagram

11. Electrical Characteristics

11.1 Absolute Maximum Rating

Parameters	Symbol	Value	Unit
DC Supply Voltage	VCC	<5.5	V
Input Voltage	Vin	-0.5 to VCC+0.5	V
Operating Temperature Range	Ta	0 to 75	°C
Storage Temperature Range	Tstg	-50 to 150	°C

11.2 DC/AC Characteristics

VCC=3.0V, Ta=25°C unless otherwise noted

Parameters	Symbol	Minimum	Typical	Maximum	Test Condition
Operating voltage	VCC	1.8 V	-	5.5 V	
Operating frequency (BANK0)	Fbank0	1.024MHz ±1%		16.384MHz ±1%	
Operating frequency (BANK2)	Fbank2		32.768MHz ±1%		
RC oscillator frequency	Frc1		65.536MHz ±1%		
Low power RC oscillator frequency	Frc2		32768Hz ±2%		
Halt Current	Ihalt1		5uA		All function off
Operating Current	Iop		5mA		no load
input high voltage	Vih	0.8 VCC			
input low voltage	Vil			0.2 VCC	
input leakage Current	Ilk			0.1 uA	
output high voltage	Voh	0.95 VCC			no load
output low voltage	Vol			0.05 V	no load
output high current	Ioh		16 mA		Vout=VCC-0.4V, PortA, B, C, I select strength driving option
output low current	Iol		-16 mA		Vout=0.4V PortA, B, C, I select strength driving option
pull-up resistance	Rpu		100K ohm		pins with pull-up, Port A,B,C
pull-down resistance	Rpd		100K/500K ohm		pins with pull-down, Port A,B,C, I

11.3 10bit ADC Characteristics

(Ta = 25°C, VCC = 2.4 ~ 6V, unless otherwise noted)

Parameters	Symbol	Minimum	Typical	Maximum	Unit
ADC clock frequency	FADC			4	Mhz
Sample rate	Fsample			285	Khz
Differential Nonlinearity	DNL		±1		LSB
Integral Nonlinearity	INL		±1		LSB
Offset error	OS		±1		LSB
No Missing Code	NMC		9		Bit
Input capacitance	INC		2		pF
Input resistance	INR			37.5 *1	K

*1. Input resistance must small than 37.5K for FADC=4Mhz and TAD=2*FADC.

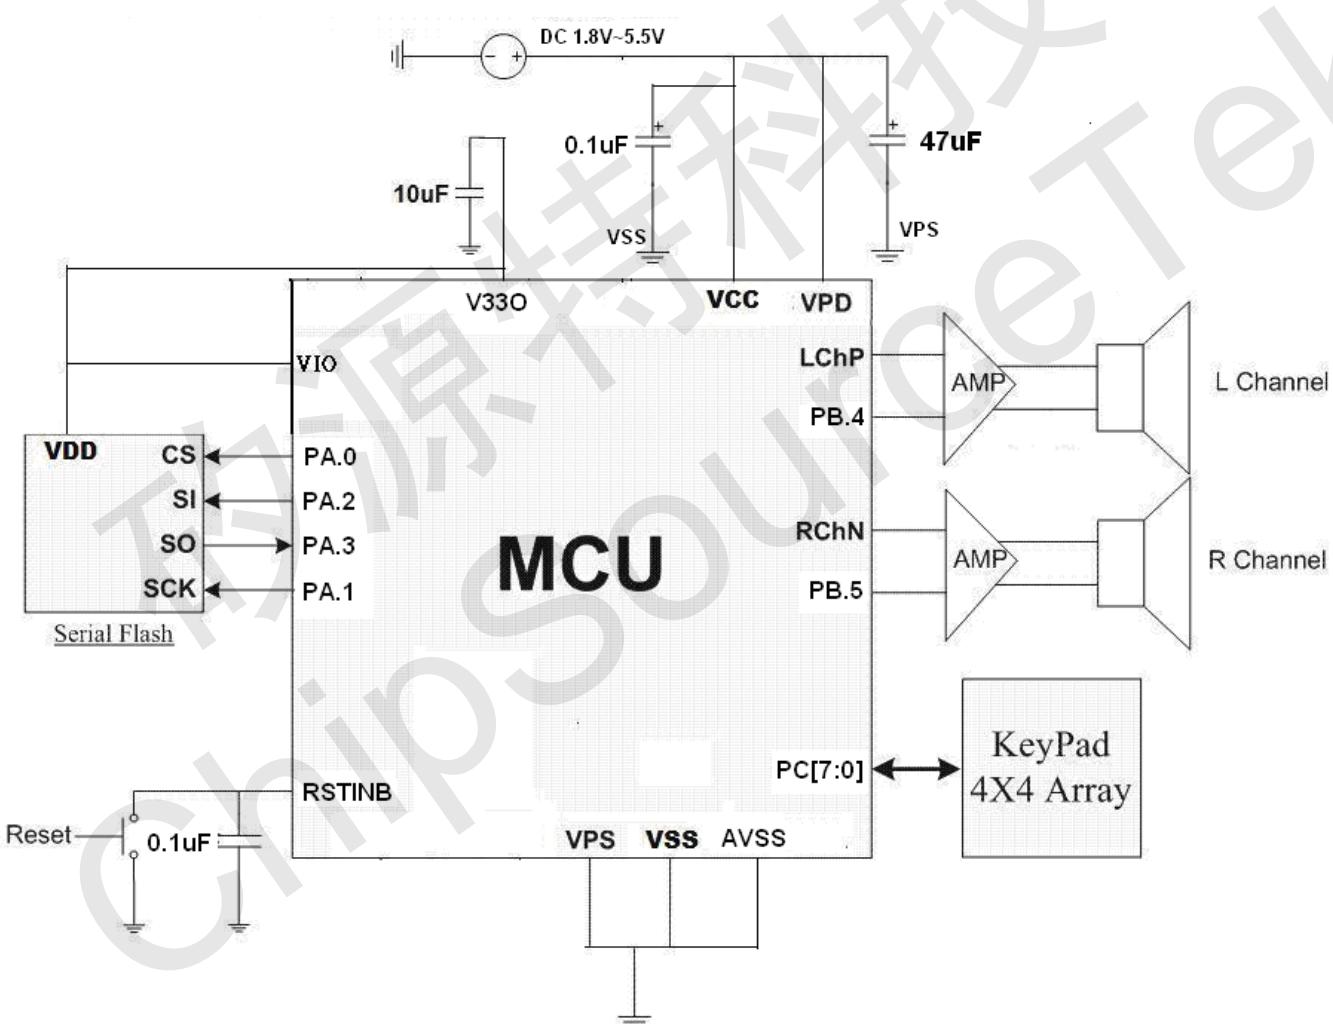

12. Application Circuit

Application Circuit 1: Stereo 16-bit PWM AMP output with Serial Flash (TYPE1)

Notice:

- 1. VPD VPS Decoupling Cap 47uF, please close to IC nearly.**
- 2. Power Path of VPD and VPS must pass through Decoupling Cap 47uF into IC.**
- 3. VCC VSS Decoupling Cap 0.1uF, please close to IC nearly.**
- 4. Power Path of VCC and VSS must pass through Decoupling Cap 0.1uF into IC.**
- 5. VSS and AVSS are as close as possible.**
- 6. PCB Layout about power line, Please refer to "Application Note(AN0059)"**

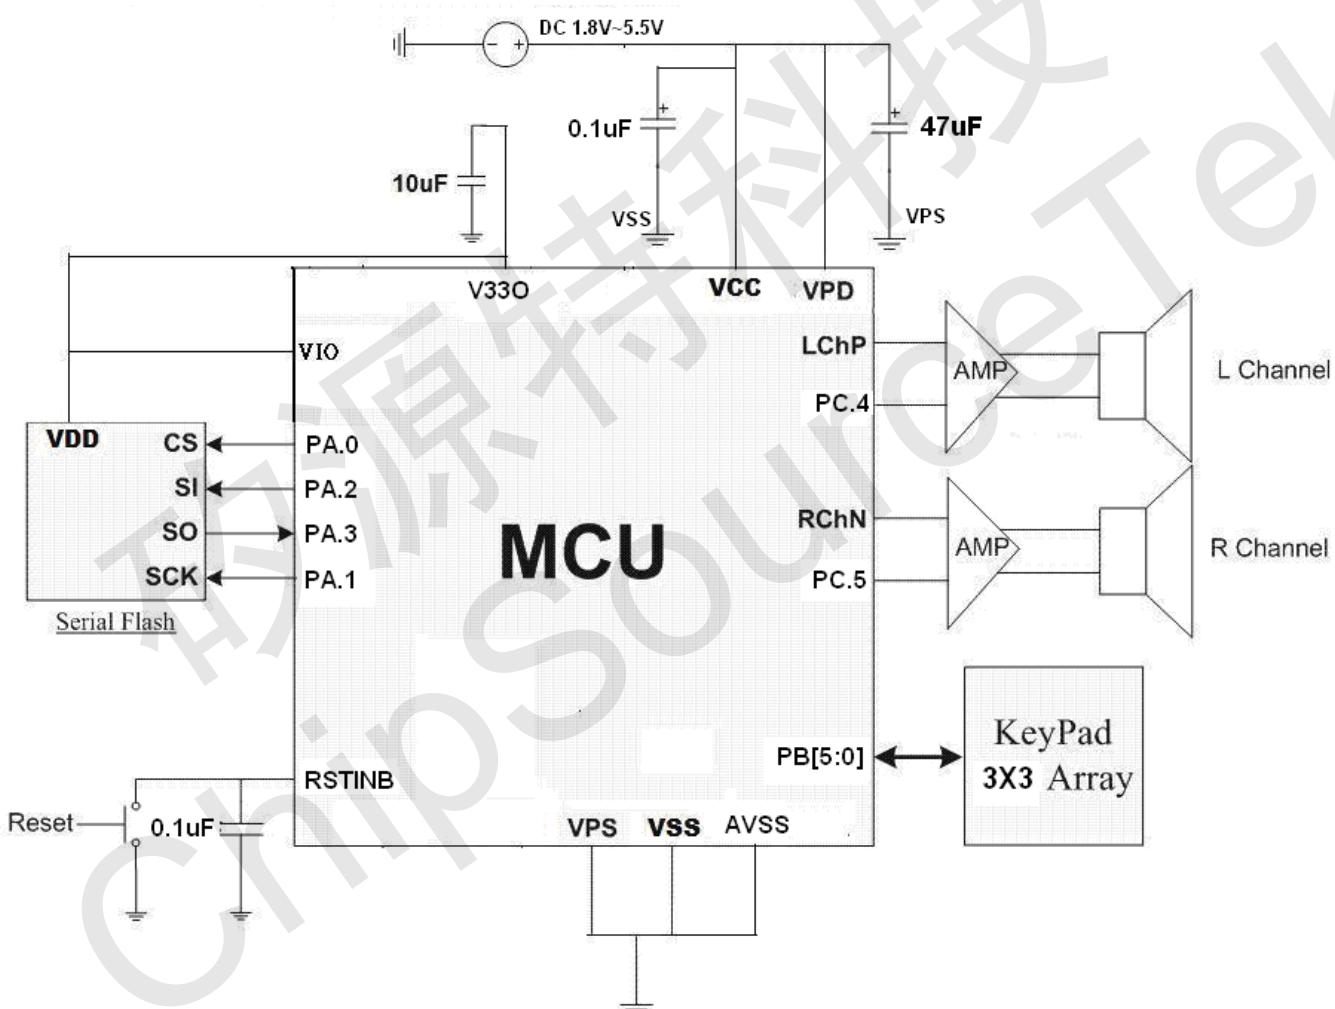

Application Circuit 2: Stereo 16-bit PWM AMP output with Serial Flash (TYPE2)

Notice:

- 1. VPD VPS Decoupling Cap 47uF, please close to IC nearly.**
- 2. Power Path of VPD and VPS must pass through Decoupling Cap 47uF into IC.**
- 3. VCC VSS Decoupling Cap 0.1uF, please close to IC nearly.**
- 4. Power Path of VCC and VSS must pass through Decoupling Cap 0.1uF into IC.**
- 5. VSS and AVSS are as close as possible.**
- 6. PCB Layout about power line, Please refer to "Application Note(AN0059)"**

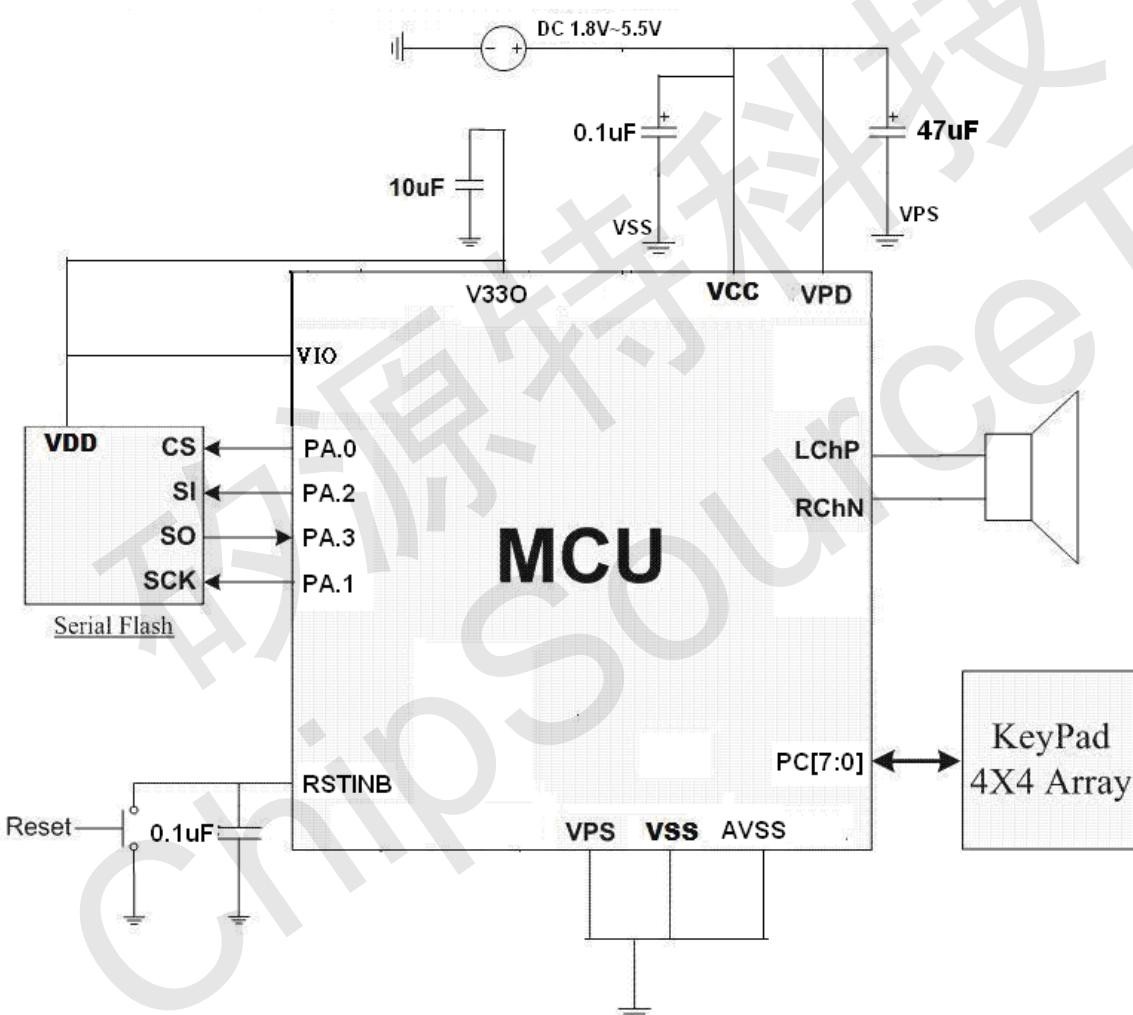

Application Circuit 3: Mono16-bit PWM output with Serial Flash (TYPE3)

Notice:

- 1. VPD VPS Decoupling Cap 47uF, please close to IC nearly.**
- 2. Power Path of VPD and VPS must pass through Decoupling Cap 47uF into IC.**
- 3. VCC VSS Decoupling Cap 0.1uF, please close to IC nearly.**
- 4. Power Path of VCC and VSS must pass through Decoupling Cap 0.1uF into IC.**
- 5. VSS and AVSS are as close as possible.**
- 6. PCB Layout about power line, Please refer to "Application Note(AN0059)"**

**13. Appendix:**

Appendix 1: PORT A PIN MAP RELATE TO FUNCTION

	PORT A (I/O Power : VIO)					
	5	4	3	2	1	0
